

To Whom It May Concern

We built a new house recently. It came to our attention when we selected the builder and house model that many new house owners complain the house quality. In order to avoid further problems, we decided to work with a home inspector to control house quality. Two friends of us recommended a home inspection company, Alpha Engineers, Inc., and its owner Mr. Larry Hughes. They offer a special program named "Progress Inspection Program" to check the house periodically in total six times during the process of building. After consideration, we selected this program.

During the construction, Mr. Hughes and his coworkers inspected the whole procedure step by step and reported us total six times. Their reports pointed out all faults in the construction even through they are small problems. With the reports we could discuss with the builder to control the quality of each part of the house. The builder was highly considered the recommendations listed on the reports and fixed all reasonable problems. The final inspection was a complete evaluation process. Engineers of Alpha Engineer, Inc evaluated the quality of the whole house thoroughly from inside to outside, and listed specific comments regarding to the problems. After reviewing the comments, builder agreed to repair the problems.

With the great efforts of engineers at Alpha Engineers, Inc, our new house was successfully delivered. We are very satisfactory for the quality of the house. We also understood our house's condition and any technique questions in the construction.

We strongly recommend Alpha Engineers, Inc to you if you have no confidence to the quality control of your new house. The inspectors at Alpha Engineers Inc are very qualified engineers, and they are always friendly and seriously consult your questions. We are very happy to work with them.
